16 October 2026

Dear Editor,

Please consider the manuscript *A reproducible spectral certificate for the nonexistence of homogeneous quartic rotation symmetric bent functions in twelve variables*.

The paper presents a computer-assisted exclusion over a binary coefficient space of dimension 43. It combines fiber Walsh identities, energy congruences and subspace Poisson constraints with a triangular enumeration. The necessity of the filters and the coverage of the enumeration are explained explicitly.

The accompanying reproducibility package contains two implementations with different spectral evaluation paths, an additional audit of the finite algebraic foundations, exact execution records, and a Lean file for selected auxiliary statements. The manuscript clearly distinguishes these checks from a complete formal proof and does not claim to resolve the conjecture in arbitrary dimension.

The discussion includes the related 2026 paper of Sun, Shi, Liu and Fu and avoids unsupported priority claims. I would welcome assessment of the certificate, the spectral reduction and their relation to existing results.

Thank you for considering this submission.

Sincerely,
Filipe Martins Vono
